Abstract

A computer is generally considered to be a universal computational device; i.e., it is believed able to simulate any physical computational device with a cost in computation time of at most a polynomial factor. It is not clear whether this is still true when quantum mechanics is taken into consideration. Several researchers, starting with David Deutsch, have developed models for quantum

[1, 2]. Although he did not ask whether quantum mechanics conferred extra power to computation, he did show that a Turing machine could be simulated by the reversible unitary evolution of a quantum process, which is a necessary prerequisite for quantum computation. Deutsch [9, 10] was the first to give an explicit model of quantum computation. He defined both quantum Turing machines and quantum circuits and investigated some of their properties.

The next part of this paper discusses how quantum com-

National Academy report on quantum computing

Don't panic. “Key Finding 1: Given the current state of quantum computing and recent rates of progress, it is highly unexpected that a quantum computer that can compromise RSA 2048 or comparable discrete logarithm-based public key cryptosystems will be built within the next decade.”

National Academy report on quantum computing

Don't panic. “Key Finding 1: Given the current state of quantum computing and recent rates of progress, it is highly unexpected that a quantum computer that can compromise RSA 2048 or comparable discrete logarithm-based public key cryptosystems will be built within the next decade.”

Panic. “Key Finding 10: Even if a quantum computer that can decrypt current cryptographic ciphers is more than a decade off, the hazard of such a machine is high enough—and the time frame for transitioning to a new security protocol is sufficiently long and uncertain—that prioritization of the development, standardization, and deployment of post-quantum cryptography is critical for minimizing the chance of a potential security and privacy disaster.”

Initial recommendations of long-term secure post-quantum systems

Daniel Augot, Lejla Batina, Daniel J. Bernstein, Joppe Bos,
Johannes Buchmann, Wouter Castryck, Orr Dunkelman,
Tim Güneysu, Shay Gueron, Andreas Hülsing,
Tanja Lange, Mohamed Saied Emam Mohamed,
Christian Rechberger, Peter Schwabe, Nicolas Sendrier,
Frederik Vercauteren, Bo-Yin Yang

Initial recommendations (2015)

- ▶ **Symmetric encryption** Thoroughly analyzed, 256-bit keys:
 - ▶ AES-256
 - ▶ Salsa20 with a 256-bit key

Evaluating: Serpent-256, ...

- ▶ **Symmetric authentication** Information-theoretic MACs:
 - ▶ GCM using a 96-bit nonce and a 128-bit authenticator
 - ▶ Poly1305

- ▶ **Public-key encryption** McEliece with binary Goppa codes:
 - ▶ length $n = 6960$, dimension $k = 5413$, $t = 119$ errors

Evaluating: QC-MDPC, Stehlé-Steinfeld NTRU, ...

- ▶ **Public-key signatures** Hash-based (minimal assumptions):
 - ▶ XMSS with any of the parameters specified in CFRG draft
 - ▶ SPHINCS-256

Evaluating: HFEv-, ...

Categories of post-quantum cryptography

- ▶ Code-based encryption and signatures.
- ▶ Hash-based signatures.
- ▶ Isogeny-based encryption.
- ▶ Lattice-based encryption and signatures.
- ▶ Multivariate-quadratic encryption and signatures.
- ▶ Symmetric cryptography.

These are broad categories. For deployment concrete instantiations are needed.

NIST Post-quantum “competition”

30 November 2017: NIST receives 82 submissions.

| | Signatures | KEM/Encryption | Overall |
|---------------|------------|----------------|-----------|
| Lattice-based | 4 | 24 | 28 |
| Code-based | 5 | 19 | 24 |
| Multi-variate | 7 | 6 | 13 |
| Hash-based | 4 | | 4 |
| Other | 3 | 10 | 13 |
| | | | |
| Total | 23 | 59 | 82 |

| | | | |
| Total | 23 | 59 | 82 |

21 December 2017: NIST **publishes 69 submissions** from 260 researchers.

30 January 2019: NIST narrows the field to 26 **Round-2 candidates** – 17 encryption systems and 9 signature systems.

Standardization progress of hash-based signatures

- ▶ CFRG has published 2 RFCs: [RFC 8391](#) and [RFC 8554](#)

The image shows two screenshots of the IETF Datatracker interface. The top screenshot displays the details for RFC 8391, 'Internet Research Task Force (IRTF) Request for Comments: 8391', categorized as 'Informational' with ISSN 2070-1721. It lists authors A. Huelsing (TU Eindhoven), D. Butin (TU Darmstadt), S. Gazdag (genua GmbH), J. Rijnveld (Radboud University), and A. Mohaisen (University of Central Florida), dated May 2018. The title is 'XMSS: eXtended Merkle Signature Scheme'. The bottom screenshot displays the details for RFC 8554, 'Internet Research Task Force (IRTF) Request for Comments: 8554', categorized as 'Informational' with ISSN 2070-1721. It lists authors D. McGrew, M. Curcio, and S. Fluhrer (Cisco Systems), dated April 2019. The title is 'Leighton-Micali Hash-Based Signatures'. Both screenshots include the IETF logo and navigation links for Datatracker, Groups, Documents, Meetings, Other, and User.

Leighton-Micali Hash-Based Signatures

Standardization progress of hash-based signatures

- ▶ CFRG has published 2 RFCs: [RFC 8391](#) and [RFC 8554](#)
- ▶ NIST has gone through two rounds of requests for public input, most are positive and recommend standardizing XMSS and LMS. Only concern is about statefulness in general.

The image is a screenshot of a web page from the NIST Computer Security Resource Center. At the top, the NIST logo is displayed in white on a black background. Below this, the text 'Information Technology Laboratory' is written in white on a blue background. Underneath, 'COMPUTER SECURITY RESOURCE CENTER' is written in white on a blue background with a geometric pattern. A green button with the word 'PROJECTS' in white is visible. The main heading of the page is 'Stateful Hash-Based Signatures' in a large, bold, black font.

Standardization progress of hash-based signatures

- ▶ CFRG has published 2 RFCs: [RFC 8391](#) and [RFC 8554](#)
- ▶ NIST has gone through two rounds of requests for public input, most are positive and recommend standardizing XMSS and LMS. Only concern is about statefulness in general.

- ▶ ISO SC27 JTC1 WG2 has started a study period on stateful hash-based signatures.

Post-quantum cryptography is ready
